All announcements are made through the News section of this page. Check it frequently.

Lectures: M & W 16:00-17:30. Room: SA 317.
Office hour: Room Herzberg 5125A. W 13:30-15:00.
Prerequisites: COMP 1805.

Description:
This course is about using different kinds of applications of symbolic logic, in particular classical predicate logic, to: (a) represent knowledge, (b) model computational problems, and (c) solve them by means of automated reasoning.

Special emphasis is placed on logical descriptions of possibly hard combinatorial and computational problems. Some automated reasoning systems will be used to model problems and compute from their logical representations, among them: Otter/Prover9/Mace, Prolog, DLV, Datalog.

The course emphasizes concepts, techniques, and applications rather than system issues. Programming of the usual kind is not considered for this course.

This course combines well with courses on artificial intelligence, knowledge representation, data management, algorithms, declarative programming, and formal methods in software engineering, but none of them is a prerequisite.

Assessment: Around 6 assignments related to the use of automated reasoning systems: 60%. Two midterm tests taken in class (the second one on April 6th): 20% each. To pass the course the average of the two tests must be at least 35%.

Reading Material (mandatory):
1. Lecture notes posted after every lecture on the course web page.
2. Relevant survey and research papers will be posted for possibly mandatory reading.
